## 1 01.14.21

### 1.1 Automaton (automata)

- Self running machine requiring a continuous power source
  - Historically used power sources include water, steam, and electricity
- Course revolves around defining the mathematics powering machines

### 1.2 The Mathematics of Automata

#### 1.2.1 Mathematicians & History

- Cantor defines sets as collections of objects
- Cantor also argues that infinities can be of different magnitudes - there are infinitely more real numbers than natural numbers
- Goedel eventually derives his incompleteness theorem
  - No logical system that contains the natural numbers can prove its own soundness
  - Every sound logical system containing the natural numbers contains valid statements that cannot be proved or disproved
- In 1936, Turing proves The Halting Problem is not decidable, it is impossible

- The Halting Problem is an algorithm that can analyze any other algorithm and determine whether or not it goes into an infinite loop
- Turing creates the turing machine as an object consisting of sets and processes wherein the object can use any finite process to complete an action.
- Turing machine sets the basis for a computer, which leads to a series of important questions:
  - What can & can't a machine do?
  - What does it mean for a problem to be harder than another?
  - What does it mean for a machine to be more powerful than another?

### 1.2.2 Sequential Logic

- Sentential Logic- based on boolean results
  - Predicated on AND, OR, NOT
  - XOR, XAND, etc. can be derived using the above

## 1.3 Necessary Review

- Textbook Ch. 0
- Logic Statements
- Set Theory
- Functions

## 1.4 Functions

- Functions - something that maps objects from one set to another
- Given  $f: a \rightarrow b$ ;
  - Everything in  $a$  is mapped to something in  $b$ 
    - \* For every  $x$ , such that  $x$  is an element of  $a$ , there exists a  $y$ , such that  $y$  is an element of  $b$

- No one point in the domain can be mapped to two different points in the codomain
    - \* Logically, you can't have a function that takes in one input and returns two different outputs
    - \* If  $f$  maps  $x \rightarrow y_1$  and  $x \rightarrow y_2$ ,  $y_1 = y_2$
- $$\forall x \in A \forall y_1, y_2 \in B [f(x)=y_1 \wedge f(x)=y_2 \rightarrow y_1 = y_2]$$

### 1.5 TODO Types of Functions - Definition & Logical Statement

- Injective Functions
- Surjective Functions
- Proof by Induction ( $\forall$ )
- Proof by Contradiction ( $\neg\exists$ )

### 1.6 Finite Automaton (Finite State Machine)

- States are logical configurations
- States are generally based upon input
- Purpose of a state machine is to make a yes/no decision
